Joineazy – Frontend Intern Assignment (Task 1)
Assignment & Review Dashboard

Deadline: Thursday, 5th November 2026, by 11:30 PM.

Submit whatever you've finished; partial work is still evaluated.

What you'll build
A responsive dashboard for a student-assignment system, with two roles: **Student** and **Admin (Professor)**.

Must-have features

Login and roles

- A simple mock login or role switcher with a few seeded users (for example, 2 admins and 5 students). No real authentication is needed.
- Each user sees only their own data.

Student view

- A list of their assignments showing title, description, due date, status and a Drive link.
- A two-step submission confirmation: "Yes, I have submitted" → a final confirmation dialog → the status changes to Submitted.
- An overall progress indicator, for example "3 of 5 submitted".

Admin view

- Create, edit and delete assignments, including a Drive link for external submission.
- Assign each assignment to all students or to selected students.
- For each assignment they created: every student's status (submitted or not submitted) and a progress bar showing the class completion rate.
- Admins see only the assignments they created.

General

- Fully responsive on mobile and desktop.
- Data is saved in localStorage or a mock API and survives a page refresh.
- Sensible empty, loading and error states.

Tech requirements

- React.js and Tailwind CSS
- A component-based structure with a clean folder layout
- React hooks (useState, useEffect). Context API or a state library is optional.
- No backend. Use JSON, localStorage or a mock API.

Nice to have (bonus)
Search or filter by status or due date, sorting, overdue highlighting, dark mode, small animations, accessibility (keyboard navigation and labels), TypeScript, basic tests.

Deliverables

1. **A public GitHub repo** with a meaningful commit history (not a single upload).
2. **A deployed link** on Vercel or Netlify.
3. **A demo video** of 3–5 minutes (Loom or Google Drive with access set to "anyone with the link") walking through both roles.
4. **A README** covering:
    - setup steps
    - folder structure
    - component architecture
    - key design decisions

Original work only. You'll walk us through your design and code in the technical interview if you're shortlisted.

How to submit

- Put the GitHub link, the deployed link and the demo video link in one PDF.
- Name the file **FullName-Task1.pdf**, for example SiddharthaThonti-Task1.pdf.

- **Upload it here**: ***https://forms.gle/SAEg6sQLbQUudzc19***

We will evaluate your submission based on the work you've done. Don't give up, and submit whatever you have accomplished so far.

Important Notes

We value commitment and responsibility. Please ensure that:

- The task is completed and submitted within the stipulated time.
- Your solution is original, well-documented, and easy to understand.
- You are prepared for a follow-up discussion if you are shortlisted.

We look forward to your submission! All the best!
